

PSU finite-aperture spectral preconditioner pilot: IID signal, joint-OOD no-go

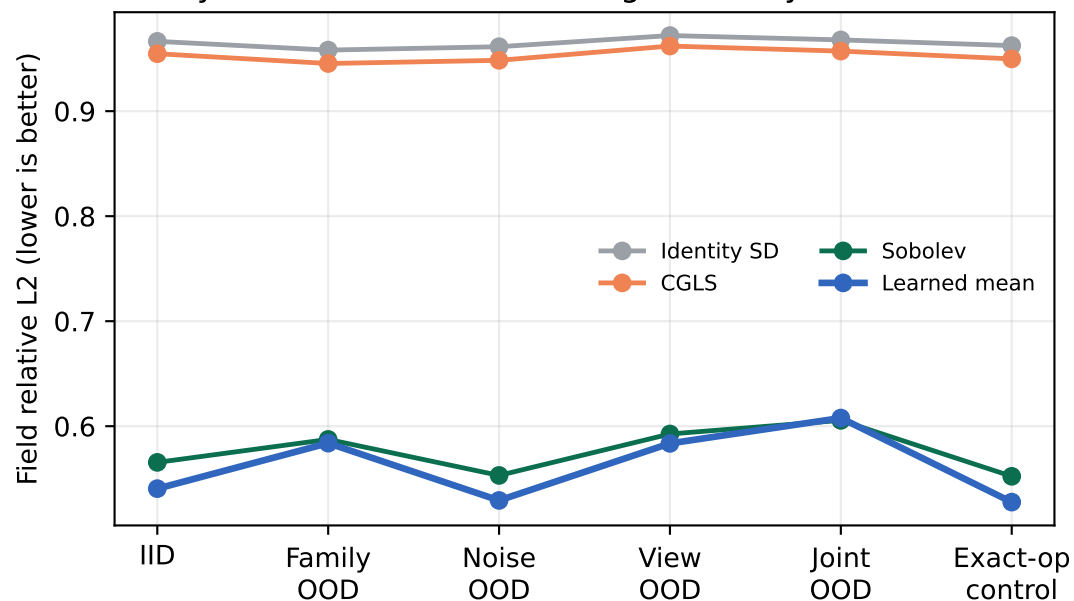

A Strong deterministic baseline selection

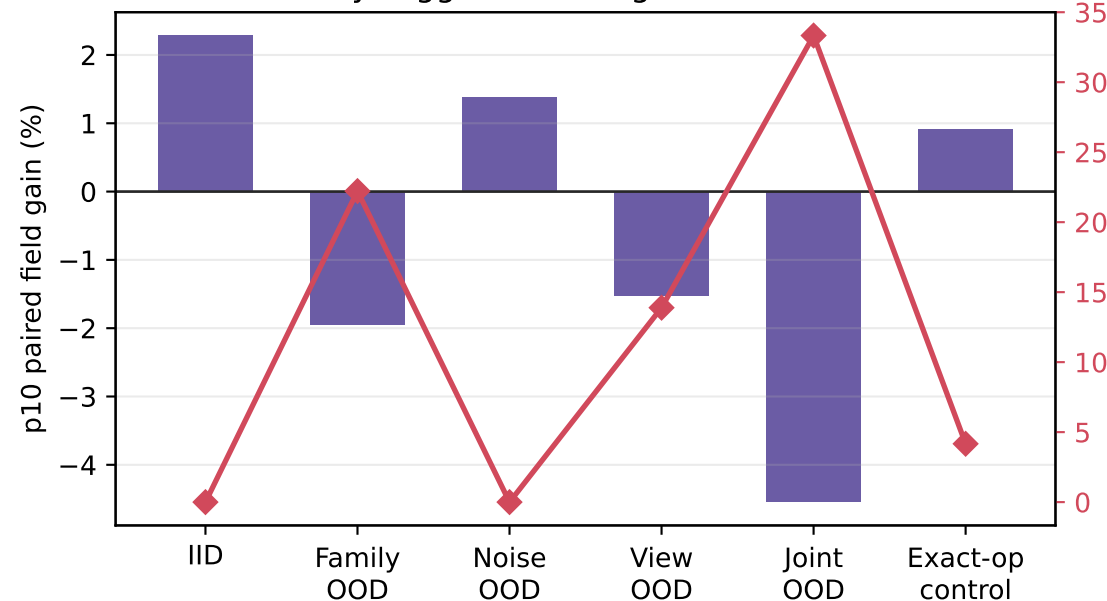

B Mean gain survives alone, not jointly

C Physics structure dominates generic Krylov baselines

D Tail reliability triggers the no-go

Real PSU support geometry + analytic morphology truth; 4F + 4A^T for Sobolev and learned methods.
No experimental 3D truth, rotation-40, final audit, FNO/DeepONet comparison, or superiority claim.
